

PawScout + Active Paw

The AI-operated commerce platform for supplier-backed Shopify stores

Product Feature List

Document version 1.0 · July 2026
Prepared for prospective tenants and partners

What the platform is

PawScout is a commerce automation platform that runs the operational side of a supplier-backed Shopify store: it answers customer email with grounded AI agents, keeps the catalog priced and stocked from live supplier data, computes honest delivery promises, and gives the owner a consent-safe marketing suite. **Active Paw** is its companion storefront: a fast, installable, conversion-focused Shopify theme wired to the same live data.

The platform's governing rule is that **customers are only ever shown information that is real and verifiable at its source**. Stock levels, delivery estimates and shipping origins come from live supplier and logistics data, never from guesses, and the AI reply system is built so that an unknown produces a safe hedge rather than an invented answer.

AI customer inbox | Supplier-synced catalog | Delivery intelligence | Consent-safe marketing | Partner program | Installable storefront | Compliance by construction

1. AI customer inbox

Inbound customer email is ingested, classified and answered by specialised agents, with the owner in control of exactly how much automation to allow.

Feature	What it does
Email ingestion & threading	Inbound mail on the store's own domain is captured, parsed (including attachments and forwarded chains) and grouped into conversation threads.
AI classification	Every message is sorted into a category: product questions, order status, shipping questions, complaints, wholesale enquiries, partnership pitches, affiliate applications, and general mail.
Specialised reply agents	Each category has its own purpose-built agent. Shipping replies quote real transit bands from the synced logistics matrix; order-status replies read the actual order; product replies are grounded in the live catalog.
Human-in-the-loop by default	Agents produce drafts for one-click owner approval. Auto-send can be enabled per agent, so trusted categories graduate to full automation one at a time.
Draft quality loop	Every outbound draft passes an automated review-and-refine cycle inside the platform before it is offered or sent, plus deterministic output rules (voice, formatting, claim discipline).
Fabrication gate	Replies about the business itself are checked against a grounded business profile so the AI cannot invent history, addresses or capabilities.
Invoicing from a thread	Wholesale and custom requests can be turned into a Shopify draft order and priced invoice email directly from the conversation, with a price floor guard.
Attribution & alerting	Conversations link to the orders they produce; urgent categories can alert the owner by email immediately.

2. Catalog and supplier intelligence

The catalog is treated as a live contract with the supplier (CJDropshipping), not a one-time import.

Feature	What it does
Product discovery & import	Supplier products are discovered by category, screened, and imported with AI-curated titles, descriptions and hero image selection. Curated add-on (basket-filler) products import alongside.
Daily stock sync	Supplier stock is written into Shopify tracked inventory every night; products that fall under a stock floor are automatically zeroed and paused, and recover automatically when restocked.
Pricing engine	Retail prices follow configurable rules from live supplier cost (freight included), with margin caps and floors, so the sticker price is always honest and profitable.
Supplier metafields contract	Availability, quantity, dispatch origin, delivery estimate and freshness stamps are written to a documented set of Shopify metafields the storefront reads. The theme never calls supplier APIs directly.
Quantity caps	Product page and cart enforce a per-line quantity cap from tracked inventory or supplier limits, so customers cannot order more than can be fulfilled.
Real-demand badges	"Selling fast" style flags are set only from genuine recent order events, never invented.
Semantic search library	Product knowledge is indexed so search and agents can match customer language to catalog items.

3. Shipping and delivery intelligence

One formula governs every delivery claim on every surface: the nearest warehouse to the customer's destination is the origin, and times come from the supplier's live logistics matrix.

Feature	What it does
Logistics matrix sync	Per-route transit times and freight costs are synced from the supplier and freshness-gated: stale data degrades to a safe hedge instead of a wrong number.
Per-product delivery estimates	Every product carries an order-to-door day range (for example "3-10 days" for locally stocked items) computed from processing plus door transit plus a small safety margin, refreshed nightly and shown on the product page and at checkout.
Nearest-warehouse resolver	Shipping quotes in customer replies and checkout profiles both use the same resolver, so the quote a customer receives matches what checkout charges.
Shipping profiles sync	Shopify delivery profiles are built automatically from each product's warehouse signature, with local items shipping free domestically where supplier freight is genuinely zero.
Market availability control	Products that cannot be fulfilled to a market are excluded from that market's catalog at checkout level, so an unfulfillable order cannot be placed.
Honest-origin policy	The storefront gives calculated delivery times without claiming a dispatch origin; local-stock claims appear only for source-verified locally warehoused items.

4. Marketing and growth suite

Feature	What it does
Campaigns	Owner-composed broadcasts to consented audiences. Buyer consent is read live from Shopify at send time; partners require a recorded opt-in. Batch sending with a per-recipient ledger means nobody is ever emailed twice.
Campaign lifecycle controls	Drafts are editable and testable; a live send can be paused, resumed or stopped; finished campaigns duplicate into fresh drafts. Consequential actions need a confirming second click.
Email engagement analytics	Per-campaign delivered, opened and clicked counts (unique recipients). Hard bounces and spam complaints are auto-suppressed to protect sender reputation.
Compliance footer	Every marketing email carries an identified sender, the business postal address, and a working one-click unsubscribe (RFC 8058). Sending is blocked until a postal address is saved.
Partner / affiliate program	Applications arrive through the inbox, invitations issue tracked voucher codes, orders attribute to the code, and every partner's performance is visible. Vouchers can be revoked; revocation deactivates the code.
Welcome offer machinery	A storefront welcome event (discount code modal with real end date) with automated voucher issue and trial-entry gating.
Reorder reminders	Consent-gated retention email for consumable repurchases, held dormant until order volume justifies it.
Traffic strategy board	A live acquisition-channel board (status, priority, next action per channel) seeded with a store-specific starter strategy, documented in the built-in knowledge base.

5. Active Paw storefront

A custom Shopify theme with no build step and no framework, designed to convert on mobile and read like a trustworthy specialist shop.

Feature	What it does
Installable web app	Web app manifest, branded icon set and home-screen install prompts (native dialog on Android/Chrome, guided share-sheet steps on iOS). Opens full screen with launcher shortcuts for search and basket.
Mobile-native layout	Edge-to-edge rendering with safe-area handling for notched devices, slim phone gutters, one-line delivery facts, and compact add-on rows that keep the cart usable.
Conversion surfaces	Announcement marquee, trust bars, seasonal event blocks, welcome offer modal (interstitial-etiquette compliant), cart drawer with cross-sell add-ons, sticky add-to-cart, FAQ accordion.
Live supplier data display	Availability, delivery estimate and demand badges render from the synced metafields; delivery facts are shown before checkout.
Search with supplier suggestions	Storefront search backfills with relevant not-yet-imported supplier products rendered as ghost cards.
SEO foundations	Structured data (Organization, product meta), collection descriptions and page titles tuned, legal pages always reachable from the footer.
Brand theming	Store name, logo, favicon and colour tokens configurable from Theme Settings without code.

6. Compliance and trust, by construction

Feature	What it does
Consent enforcement in code	Marketing audiences are resolved from live consent state at the moment of sending. A shared suppression list covers every marketing surface; order email is never affected.
Privacy policy keeper	The console checks the live privacy policy against recommended wording (opt-in marketing, engagement measurement, unsubscribe, business address) and applies missing pieces in one owner click.
Claim discipline	Deterministic gates keep customer-facing text free of unverifiable claims: no invented fulfilment locations, no fabricated business history, conservative fallbacks when data is missing.
Output hygiene	All outbound text passes runtime sanitisation (typography rules, formatting discipline) so automated mail reads like a person wrote it.
Audit trail	An owner-facing audit view records what the automation did and why, with health stamps for every scheduled job.

7. Operations console

A single embedded console inside Shopify admin runs the whole platform. Ten views, keyboard navigation, and a built-in knowledge base that documents every behaviour in plain language.

View	Purpose
Glance	Counts, attention queue, recent activity and automation health in one screen.
Inbox	Threads, drafts, approvals, invoicing, reply-mode banner.
Catalog	Import pipeline, product states, pricing and stock levers.
Operations	Order pipeline and fulfilment flow.
Audit	The automation's decision log.
Partners	Affiliate applications, vouchers, attribution and consent.
Campaigns	Broadcasts, engagement analytics, sender details, policy keeper.
Traffic	The acquisition strategy board.
Settings	Supplier connection, AI model choice, reply mode, inbox configuration.
Help	The full knowledge base, searchable by topic.

> **Automation cadence:** a nightly maintenance chain (stock, pricing, delivery estimates, shipping profiles, market availability, collection refill) plus a 15-minute pipeline for orders, inbox classification and market reconciliation. Everything the automation does is resumable and idempotent; nothing marketing-related ever sends without an owner click.

8. Platform and security

Feature	What it does
Multi-tenant core	Every table, credential and configuration is scoped per shop. One deployment serves many stores with strict data isolation.
Encrypted credential vault	Supplier keys, tokens and webhook secrets are sealed with a per-tenant data key wrapped by a platform master key. Secrets never appear in logs or leave the worker.
Managed Shopify install	Standard Shopify app install with token exchange; no manual API keys, scope upgrades handled through app releases.
Edge infrastructure	Runs on Cloudflare Workers with a D1 database: globally fast, no servers for the tenant to run, scheduled jobs built in.
Integrations	Shopify Admin GraphQL, CJDropshipping API, Resend transactional email (with signed event webhooks), and a bring-your-own-key AI model layer with a curated model catalog.
Tested	The platform ships with an extensive automated test suite covering the sending machinery, consent gates, pricing, logistics maths and the console itself.
